A: It is a Virus. In your case you've downloaded a virus. It is detected in some antivirus software as the listed below. On a closer look: It changes your Browser in the "Unsafe" mode. It makes your Internet Browser to go to the specific sites. It delete some files. It change your browser shortcuts. It changes your desktop items. It make you to add some more toolbars. It damage your computer to some extent. The antivirus software reports the virus as some virus name: "KonyCalc.rar". A: We had this virus on our laptop, it does this sort of thing. The file was called: KonyCalc.rar. Be careful and get a good antivirus program. You should run some program like this: libGDX; when is a message sent from one actor to another? I can't find a way to send a message from one Actor to another. If you are familiar with "Gui" project (libGDX), you know that in the MainActor there is a component called GUIListener. It listens to messages like "create" and "render". How can I send a message from one Actor to another? I thought that I should use something like... actor1.send(message); But, from what I can read, it doesn't make a difference between "send()" and "message()" methods. I would be grateful if someone could help me. EDIT: for example, if I have two text fields and one Button, I want the button to send a message to the actor with id actor1 when it is clicked. Thanks in advance! A: Gui message from an Actor to another is in any case called message. All the message() methods in Actor in fact simply send a message to the self and so calls the getCurrentMessage() or getMessageReceived(msg) methods. So if you want to send a message between two actors: Actor1.send(Message) or Actor2.send(Message) 2d92ce491b
