Q: Algorithm for finding shortest path between two nodes in a graph with unequal edge weights Given a graph  $G = (V, E)$  with two nodes  $S$  and  $T$ . Let the edges  $E$  have edge weights  $w_1, w_2, w_3$ , and  $w_4$  and  $w_5$ . Now, I want to find the shortest path between  $S$  and  $T$  which visits the lowest edge weight. Can anyone please suggest me an algorithm to find such a path? A: Naive approach : Run Dijkstra's algorithm from  $S$  to  $T$  with a minimum edge weight as the weight of the shortest path. As a side note, if you want a path that goes through the lowest weight, you should use the arc-weighted shortest path algorithm instead of the minimum weight one. Exponential Time Solution: I suppose you are looking for the shortest path that goes through the highest edge weight. Instead of Dijkstra, you can use Floyd
