Stop I'm using Newton's Method to try to solve this equation: $$ y = x^2 + 2x - 7 $$ where x is the unknown. As I understand it, Newton's Method will start with $x_0 = 7$ (or some other value close to the answer) and use the derivatives of the equation to calculate the next iteration of x: $$ x_{n+1} = x_n -

\frac{f(x_n)}{f'(x_n)} $$ After that, you keep repeating the process until either: the value of x is a root of the equation, or the difference between the current value of x and the last value of x is smaller than some pre-determined threshold (I haven't gotten this far in class, so I'm not sure if this is even

necessary). If I understand correctly, the process ends when the derivative $f'(x_n)$ of $f(x) = x^2+2x-7$ is close to 0, which means that the second possibility is most likely what I should do. I'm really struggling to get the code for it to work, however, because I can't figure out what to put into the

derivative. Here is what I have so far: for(x in 0:100){ for(y in 0:100){ if((x - y)^2 > 0){ tmp = (x - y)^2
