A: This isn't a malware infection, but it is malware. It is a "scam" in the sense that it was probably intended to convince people to pay money for software that they don't need, and in the sense that most likely the author of it will make money off it. The only obvious reason that the download could look like a legal one, is if the author of the site was hacked, and the hacker was trying to send people to the site using a simple redirect. There are thousands of sites like this on the internet that look just like the one that you linked to, but they are all offering malware. What to do? Don't install any software unless it is provided by someone you know and trust. Don't click on any links from someone you don't know. Don't reply to any emails asking you to pay money. If you are redirected to a website, make sure you know exactly what is on that website, and that it is not one that you would want to visit. If the site asks for your personal information, don't share it. If the site looks like it is trying to scam you, it probably is. If it does ask for your personal information, I wouldn't trust it. And if you do decide to click through on a link to a site like this, take steps to protect yourself from harm, such as running spyware programs that will alert you if someone is trying to trick you into clicking on some sort of link. You can get some spyware programs for free from online malware download sites, and/or from the software store at Apple. A: You seem to be using pirated software. In some sense, it's not very surprising to come across someone else using your same software with a modified source code, as you seem to be using software that's not properly licensed. The problem is that this probably goes beyond your friend, and you'd want to know who the real owner of this software is, and get in touch with him or her. Otherwise, you'll be spending a great amount of time and resources that could be better spent on things more important than this. The only way to be sure about this is if the creator of the software sends you a message. If it has a

---

monetary transaction involved, the creator is almost surely lying. Even if you do receive the message, it doesn't matter, because you shouldn't be using 2d92ce491b
