Batch-Saving Layer The Export Layer command allows you to choose a batch of the current drawing and export it into a new drawing. Export layers are similar to Microsoft's Tagged Image File

Format (TIFF) exports. You can also batch export individual layers from a drawing. In addition to export files, you can export layer properties such as layer styles, fill and line type, and widths. When you export to a new drawing, you can save the properties of the current drawing and export them into the new drawing. You can also manually save the properties and export them to the new drawing. Layers menu You can open and close layers by choosing the Edit command (menu Edit > Edit Layer or Ctrl+E). You can also print or export a layer's properties to a new drawing. You can change the layer display order by choosing the menu Commands > View tab > Show/Hide Layer Order. This also enables you to toggle between the layer list (in which you see the drawing layers) and the layers list (in which you see the layers arranged by name). You can drag and drop layers from one drawing to another to merge them or create groups. Layer structure menu You can use the structure menu to manage layers. In the structure menu, you can hide the layers, add layers, remove layers, toggle between layers and layers with visibility, merge layers, and delete layers. New drawing This command opens a new drawing with the same layers as the current drawing. You can open a new drawing from a layer in the

Visual LISP AutoCAD and Visual LISP is a CAD/CAM/CAE tool and programming language developed by Autodesk. Autodesk calls Visual LISP a "user-defined language", a feature not supported by any other CAD software. The Visual LISP programming language allows users to create their own macros and extend the capabilities of the software. Visual LISP code (called a "custom user-defined function") consists of a series of statements separated by semicolons (;). Unlike traditional programming languages, the name of a Visual LISP function, variable, or parameter can be any arbitrary string of characters. Visual LISP code can be accessed via Visual LISP viewers, similar to the VIW viewers in the operating system used to edit.text files, such as Visual Studio. Visual LISP can use the autocompletion feature of Visual Studio and the two can be used side by side in a single project. Unlike Visual Studio, Visual LISP does not allow users to modify the code for other users (revision control), nor provide a compiler for the code. However, Autodesk Visual LISP (A-LISP) has a command line compiler that allows users to compile A-LISP code into DLL's which can be used in other software. Visual LISP allows the creation of windows applications to be done by having the application window within a system window. The program's visual programming capabilities allowed the creation of a number of icons for the feature icon library. Visual LISP code can be saved in various file formats. The file extensions for saved Visual LISP files are.vlf and.cls. The file extension for files created by the command-line compiler is.clt. Visual LISP modules, or.cls files, are executable files and can be run in batch mode. The visual programming aspects of the programming language allow for the creation of modules (like a program), complete with their own main and initialization function, which are then available for users to include as a subroutine in their own modules. Users can also access Visual LISP from other Visual LISP code. A-LISP files (.cls) contain many functions written in Visual LISP. In addition, A-LISP files allow Visual LISP to be written in a 5b5f913d15
