Field of the Invention The present invention relates to a vehicle-side electronic control device, which supplies electric power to a power supply, a powered machine, or the like on a vehicle body, in order to operate the device and a

vehicle-side electronic control system including the vehicle-side electronic control device.

2. Description of the Related Art

There is known a motor vehicle having a vehicle-side electronic control device electrically powered by a battery. The battery is a battery for supplying electric power to the vehicle-side electronic control device. Such a conventional electronic control device has a voltage detector for detecting a battery voltage and a voltage

regulator, which controls a voltage supplied to the electronic control device by the battery. When the battery voltage detected by the voltage detector is lower than a predetermined threshold voltage, the voltage regulator starts regulating the voltage supplied to the electronic control device, thereby preventing electric discharge of the battery. When the battery voltage is low, the voltage regulator starts regulating the voltage

supplied to the electronic control device, and the electronic control device starts operating in response to the voltage supplied from the voltage regulator (see Japanese Patent Application Laid-open No. 2009-179913, for example). The voltage regulator starts regulating the voltage supplied to the electronic control device, and the electronic control device starts operating in response to the voltage supplied from the voltage regulator, even when

the battery voltage is in a predetermined operation range. Thus, the electronic control device supplies the voltage necessary for controlling operation of a powered machine. When the voltage regulator starts regulating the voltage supplied to the electronic control device when the battery voltage is in a predetermined operation range, electric discharge of the battery due to excessive regulation by the voltage

regulator stops. Accordingly, when the battery voltage is in a predetermined operation range, the voltage regulator causes a decrease in the amount of electric current flowing through
