What Would Photoshop Do? With the update to Photoshop CS6 came a new "actions" application that enables you to create multiple reusable actions. An action is a standard document creation template that you save, and by selecting one of the saved actions you can then apply it to any photo you want. And if you find that an action you've created meets your needs, you can purchase the

action pack from Photoshop.com for \$2.50—about the price of one 2x2 printout. In the following example, you'll see how to use the _What Would Photoshop Do?_ action pack to create a nice copy-and-paste style edit to an image. Although these steps illustrate a simple action, you can create any number of edits to your images using this method. Figure 14-18. The What Would Photoshop Do? action pack. This action/template is designed to help you quickly edit a document without having to constantly do the same work over again. Bilateral vestibular evoked myogenic potentials in sensorineural hearing loss with vertigo. The objective of the study was to evaluate the utility of bilateral vestibular evoked myogenic potentials (bVEMPs) as a clinical tool for patients with sensorineural hearing loss accompanied with vertigo. bVEMPs were recorded in 22 patients with idiopathic labyrinthine disease. In the caloric test, the direction (right vs. left) and the velocity of both 30 degrees left and 30 degrees right gaze-evoked nystagmus responses were analyzed. Unilateral caloric vestibular response to

the 30 degrees right or left test was suppressed in eight (36.4%) and 20 (90.9%) of 22 patients, respectively, whereas bilateral response was normal in 21 (95.5%) of 22 patients. The direction of gaze-evoked nystagmus response (30 degrees right > 30 degrees left or vice versa) was significantly correlated with suppression of caloric nystagmus response. The velocity of both 30 degrees right and 30 degrees left gaze-evoked nystagmus responses was significantly correlated with unilateral caloric vestibular response. The present study suggests that unilateral vestibular function is affected in patients with sensorineural hearing

loss accompanied with vertigo, and it can be quantitatively evaluated by bVEMPs.

1. Field of the Invention This invention relates to the general field of instruments used to obtain tissue samples. More particularly, the present invention relates to an apparatus and method of obtaining a sample of internal tissue, such as ear tissue, from a live subject, without general anesthetic, and without reliance on external refrigeration equipment.

2. Description of the Prior Art There are many situations in which it is important to obtain a tissue sample from an internal structure of a live subject. For example, it is of critical importance to

medical science and the pharmaceutical industry to rapidly obtain samples of ear tissue for research purposes or the development of new drug therapies.

Although ear tissue can be obtained via a variety of techniques that do not require general anesthesia, such as scraping, a more expeditious and less invasive method of obtaining ear tissue samples is to perform a biopsy. A biopsy generally is performed by first making a small incision in the patient's ear to form a hole through which a large needle is inserted. The needle is then used to extract a tissue sample. One of the primary concerns with all biopsy and ear
